

**3/10**

## MEETING NOTES

- Be aware that future meetings may need to be on zoom
- We will need to properly cite them as appropriate
- Discuss among selves:
  - When completing design document, make sure it reflects our vision of two orthogonal entities - one is what we will do next semester, the other is why someone should consider our project
  - Start constructing the “plane” between these two topics now
  - Provide a basic use case with users - bob, alice, jack example
  - Show how if these people were going to use github, our project would enable them to do x & y etc more effectively
  - This will allow us to sell our product better
  - All in all we need to develop a more concrete story
  - Use cases will allow us to fill in gaps in our story
  - Make sure to keep project very realistic, almost try to underestimate
  - In final presentation we want to be able to say “ in addition to what we proposed, we went above and beyond” ... this looks much better than not accomplishing what we promised
- Should show something visual (like the example today) in the design doc, but not required.
- Instead or in additional to this, we need a solid design document
- It should be good enough that another team could read our doc and be able to move on with it

## TO DO

- Figure out database plan
- Figure out use cases (main use case with actors)
